Project B: Dear future...

Presentation: Due May 5, 2026

Documentation: May 11, 2026

Introduction

*...after returning from this year's Generative Biodiversity Congress where your recent discovery has been lauded by the international scientific community, you find yourself once again under the fluorescent lights of the IMA studio hunching over your laptop. The screen displays intricate coding as you tinker with your latest project—a **revolutionary internet portal capable of sending a website one thousand years into the future.***

"It's done," you whisper triumphantly, your fingers trembling over the 'Activate' button.

Without hesitation, you press it. The laptop whirs to life, emitting a faint hum as the portal shimmers into existence. The studio quivers with energy, and a low, pulsating sound fills the air.

"Wow, it's actually working!" you say in disbelief, your voice tingling with excitement.

*As you **select the interactive net-art project you made for Project B to send through the portal,** a sudden scream echoed through the IMA studio. Startled, you turned to see a 保安 Security Guard standing at the entrance, his eyes wide with shock.*

"What did you do?" he shouts in Chinese, his voice laced with fear.

Before you can respond, the portal flickers and vanishes, leaving nothing but a lingering sense of unease in the air.

Description

"When the machines are on and your fingers are on the keyboard, you are in connection with some space that is beyond the screen. And this space is only there when the machines are on. It's a new world in which you enter. (...). It's not about things, it's about connections."

[Robert Adrian | Agents Of Change: The Internet, Net Art and How The World Wide Web Has Created A New Medium](#)

Internet art is more than just art that has been digitized and uploaded online. Net artists utilize this medium to spread a message, either political or social, by taking advantage of its experimental nature, interactivity, and the ability to connect across diverse social and economic cultures.

For Project B, you are asked to build an **Interactive Internet Art Project** that will be part

of an art exhibition one thousand years into the future. Your artwork will be exhibited and deliver a message to an audience connected to the internet many years and/or far away: *What message will you send through the internet portal?*

Extended Description:

In the previous projects and recitations, you created interactive drawings, experimented with generative motion, designed patterns, and more. The prompts largely revolved around the specific technical concepts you were introduced to at the time.

Project B expands this focus, allowing you to explore your new skills as a grammar to treat **a subject you have personal connection to, or interest in**. Consider what information you want to deliver and how; for example, can one engage best with your subject if you include playful interactions? interactive story-telling? or is this a type of experimental new language with sound and/or visuals?

Consider the **technical competencies** you have developed in this course, and the creative ways we can use code, human-computer interactions, the internet and the computer. Try to incorporate different things you have learned this semester and explore how they can be **combined in a meaningful way**.

Next Weeks (and what you will still learn):

In the remaining weeks, we will build upon our previous learnings: you will get to know **Object-Oriented Programming (OOP)** to structure your code, and be introduced to advanced techniques for your project including working with sound, images and pixels. Optional Expanded Lectures dive deeper into interaction, sound, and pixel-based projects respectively.

Requirements:

Your project should be accessible to the public on **a website hosted on GitHub (introduced in Week 6)**. Your Internet Art piece should **include at a minimum** one canvas that is controlled by **p5.js**. The central part of your p5 code should be at least one class (**OOP**). Additionally, the project should feature creative and experimental forms of interactions, as well as the use of sound and/or images and pixels.

 **Project Proposal. Due April 2, 2026** ([detailed prompt](#))

This will be delivered in the form of a short Google Slide deck and presented in class.

✨ **Project Presentation. Due May 5, 2026**

Your project must be finished. People without your instruction or supervision should be able to successfully engage with it.

 Project Documentation. Due May 11, 2026 ([detailed prompt](#))

The documentation includes two components: one to introduce your project to a public audience and another one for you to reflect on your process and the outcome.

Reminder from CCLab's syllabus:

It is important that your code is written by yourself and only uses the concepts and syntax that are part of CCLab's course materials (e.g. you shouldn't use vectors in your code since they were not covered). If you have experience with code or syntax that was not covered in the course, you must consult with your instructor in advance whether you can use it for your project. You must not use ChatGPT or other AI tools for any purpose other than idea generation. **When using these tools, your instructor might not be able to assess your progress in this course, therefore, your grade in the assignment will be an F.**

Please also review the CCLab Academic Honesty Statement:

 Creative Coding Lab - Syllabus | Spring 2026

Project Proposal Prompt

Project B: Project Proposal

DUE Apr 2, 2026

INTRO

This proposal is a little bit different. As part of it, you are asked to add a secondary, physical component to your **Interactive Internet Art** project. For ideation resources, please check the [RESOURCES tab](#) in this document.

Your Proposal includes: (1) Presentation & Blogpost and (2) a time capsule 📦

PRESENTATION AND BLOGPOST

1. **Project Description:** In one paragraph (**200-300 words**), describe your idea. To use the language of the [Project Brief](#), *what message will you send through the internet portal?*
2. **Visual Prototype:** On a paper (iPad or Photoshop works, too), create a drawing that visually explains your idea. This should serve as a visual reference for your idea, but also explain its behavior and our interaction with it. The visuals are used in your individual meetings with your instructor, your blogpost as well as your presentation. (optional [template](#))
3. **Presentation:** Prepare a short Google Slide Deck containing:
 - a. the [working title](#) for your project.
 - b. 1-2 sentence description (not more!)
 - c. **2-3 references** that you found. References should inspire aspects of your project (here are some starting points for [inspiring projects](#)). This can be inspiration that you plan to use for its design, **concepts from the readings**, or projects that are dealing with the same subject in a way that you find inspiring. Provide a link to these materials and 1-2 sentences why you

selected them.

TIME CAPSULE

You have received a cardboard box 📦 from your instructor.

1. place one or several objects inside the time capsule 📦
2. seal it well 🔒
3. mark it with your name or additional decoration 🖋️
4. don't tell anyone what you have put inside 😊

You will open the box during your final presentation of this project. It's a time capsule.

Consider the following:

- Your **Interactive Internet Art** piece and box are **a combined experience** 🔗 that complement each other.
- how is your **Interactive Internet Art** piece connected to you and the (physical) reality that you live in.
- whatever you pack (1) should not get moldy, (2) not be alive, and (3) not be of crucial necessity to you before Week 14.

HOW TO SUBMIT

- On your blog, post your full project description and a link to your presentation and submit it via Google Classroom.
- In addition, please post a link to the slide deck into your section's Slack Channel at least 1 hour before class. You will present your idea in a very short presentation. Design your slides so they help you to effectively communicate your idea.
- Bring your sealed time capsule 📦 to class on **DUE Apr 2, 2026**. Hand it to your instructor for storage. And, once more, keep the contents of this box a **SECRET!**

Deliverables & Documentation

Project B: Deliverables & Documentation

During Finals Week, the Project B Deliverables include **two separate submissions**.

Mon	Tue	Wed	Thu	Fri	Sat	Sun
Submission of Slides and Github Link	Submission 1 In-class Presentations 1		In-class Presentations 2	IMA Show 🎉		Submission 2

Submission 1:

- Provide key details about your project for its public display at the IMA Show, including
 - the **title**, a brief **description**, and the **link** to your project on GitHub Pages.
- This submission is **due** on the day of the **first** in-class project presentations.
- Submit the details **via** [the specific form](#) shared on Google Classroom.

Submission 2:

- Write a detailed blog post documenting the **process**, **outcomes**, and **reflections** of your project using the guidelines below.
- This blog post is **due by the weekend** after the IMA Show.
- Submit the link to your post **using the usual project submission** form on Google Classroom.

Documentation & Reflection: Guidelines for Submission 2

The primary audience for this text is your future-self, your classmates and your instructor. You are asked to describe the process you went through in producing the work, as well as reflect on the outcomes and your learning.

This reflection should at a minimum address the following:

1) Process: Design and Composition

- Describe the design process for your project. Explain the decisions that led to its visual appearance and user interaction.
- Make sure you include initial ideas, iterations, things you tried that didn't work, and conclusions you reached.
- Discuss what you have found of value to build upon in your project, and in what ways your final work is different or better.
- Supplement the description with 3-4 screenshots that show key elements of the project's visual design and interaction.

2) Process: Technical

- Explain the inner workings of your code in detail. In your own words, and with the help of screenshots, code snippets or possibly diagrams, break apart the logic behind your code, illustrating how different sections are functionally related.
- Describe the technical challenges that you faced, solutions you found as well as compromises you had to make.
- What could have been implemented better and what changes you would make if you had the chance to do it all over again. What discoveries did you make along the way?
- Be as **detailed** and **specific** as you can.

3) Reflection and Future Development

- Summarize your conclusions and critical reflections on your work.
- Discuss how your project evolved from the project proposal to its current version. Consider how well the project achieves the concept you set out to explore: which parts of the project work well and which ones you are less satisfied with.
- Reflect on feedback received from peer students, instructor and guest critics. Describe any adjustments you made based on this feedback.
- Outline what you would like to implement further and how you might continue exploring any of the ideas from this project in future work.

4) Credits & References **IMPORTANT!**

- Acknowledge and transparently describe any technical help you received beyond

the course materials (e.g., tutorials, guides, or other resources).

- Cite readings, references, and projects that inspired your work, conceptually or visually.
- Include links.

RESOURCES

Questions for your Ideation Process:

In your creative process you have to think about key questions:

- How do you imagine the future?
- What do you want to communicate on this page, and why? What message will be worth for future viewers to uncover?
- Who will be the audience of this exhibition? Humans, non humans, or both? ([ref1](#), [ref2](#))
- How will the audience be able to interact and understand your artwork and message?
- How will your page be rendered then? Will the future viewer see them on an ordinary rectangular landscape display?

Additional References

📦 Physical **artifacts tell a story** about the times in which they were created. By deliberately packaging content to be discovered in the future, we become authors of the present.

📦 Andy Warhol, one of the most famous artists of all time, over the last decade of his life, [packed 610 boxes with 300.000](#) items which he referred to as TIME CAPSULES ("TC").

Unpacking them 20 years later, we can not only **imagine his everyday life and the objects he surrounded himself with**, but also understand his mind in an unmediated way, and ultimately see his artistic oeuvre in a new light.

📦 [Rhizome](#) is a nonprofit organization that has played an integral role in the history of contemporary art engaged with digital technologies and the internet. A central part of their mission is the conservation of digital art – **how can digital art that works on current platforms** (e.g. SD Cards formats, iPhone 13, a specific operation system etc.) **be experienced in the future?** Are they different from *physical* work in this regard? What is the materiality of a code-based artwork?

Additional Tips

* Where to start?

The best topic is one that you have genuine **interest** in and **enjoy** thinking about. Consider also the following:

- If you see a **connection** between the topic and some of the various forms and techniques we have encountered in this course, that would be a good starting point.
- Can you think of aspects of this topic that are well-suited to be **translated into code**?
- Also, consider the technical difficulty that realizing your idea would require, and whether you feel comfortable with it?
- Optional: The Expanded Lecture Videos may help you decide on the scope of your project and how to approach the technical development of your idea.

* How to develop your idea?

Imagine you sit in the studio working on your project. Someone walks by and, seeing how focused you seem on your work, asks you "What are you working on?".

This is about the answer to this question. Try to express in a few words, what your project attempts to be? Here are some points to consider:

- Is the form you pick within the possibilities of the techniques learned in this class and seems realistic given your skill level?
- Have you seen other projects of the same kind that you particularly like and can get **inspiration** from? This, too, will be part of your Project Proposal.
- Visitors of your page should be able to interact with your project without your instruction or supervision.

Inspiration / Possible forms:

Story Game	Interactive journalism or documentary	Pixel
A tool	manipulation	
	A simulation	Generative visuals
Interactive audio visualization	Story	
Interactive visualization	Text generation	Generative sound

* Where to go from there?

Your first idea might not be the one with the most potential. Explain your idea to your friends, fellows and instructors and hear their feedback. A crucial consideration is whether subject, form and your ability to realize it can come together. Is this idea achievable with the techniques learnt in class? Or would it require learning a whole new technology or language?

Once settled, consider the following timeline and don't forget to document your process well (screenshots, notes, work-in-progress copies of your code).

Week 8: Project Brief (Tue)

You should be here: This week, you need to identify the topic & form of your project and draft the proposal. Ask your peers for feedback. Arrange a meeting with your instructor to talk through your ideas.

Week 8 and Week 9

Key-Learning for the Project: Object-Oriented Programming (OOP)

Week 10.1: Individual Meetings with your Instructor

Please come prepared with an idea and an effective way to communicate this idea (visuals!). An initial prototype would be ideal.

Week 10.2: Proposal is due (Fri)

You should be here: This week, your project should begin to take form. The most tricky parts are yet to be resolved, but this week is a good time to build out the foundation of it.

Week 13: Interaction Day (Thu)

You should be here: The focus is now exclusively on the code. Tackle the most intricate parts and make your friends test, test, test your project. On Interaction day, your project should be nearly complete.

Week 14: Presentations 🥂

Project Description Writing Example

Winnie Wang, Mirroring Loss: One Year In One Minute

PROJECT DESCRIPTION

MIRRORING LOSS: ONE YEAR IN ONE MINUTE

2021

Interactive Installation

Kinect, Monitor, Sound, Soil

Mirroring Loss is an artwork that serves as a meditative ritual to bid farewell to the people who lost their lives due to Covid-19. As visitors approach the installation's display, an artistic visual interpretation of 17 months of worldwide accumulated deaths are generated within the mirrored digital body. Particles that represent the human body and life fall from above and accumulate on the ground in a ratio to death number, a process to watch oneself in the mirror dissolve piece by piece. Here, the mirror helps us become consciously aware about the large number of deaths caused by Covid-19, and at the same time to reflect on the collective human loss. The artwork becomes not only a place to mourn, but also to celebrate life, affection, and empathy.

《镜像中的消逝》

互动装置

Kinect、显示屏、声音、土壤
2021

《镜像中的消逝》是一件有冥想意味的艺术作品，为因新冠病毒而失去生命的人举行一场葬礼。当参观者走近装置的展示区，17个月的全世界累计死亡人数就会通过镜像中的数字艺术视觉呈现。代表着人和生命本身的粒子系统会按照死亡人数的比例从空中落下，在地面上积累。在这个过程中，我们看着镜子里的自己一块一块地分解，反思这场全球灾难中人类集体的损失。《镜像中的消逝》不仅让我们悼念消逝，也带领我们庆祝生命、情感与共鸣。
